

Circular Wood for the Neighbourhood

Tony Schoen, HvA Robot Lab

**What is the
Robot Lab ?**

RL = Integration

Education

Research

Practice

The DPRG is connected to the Center of Expertise Urban Technology and operates within the Robot Studio of the AUAS. The DPRG explores the impact of digital design and production technologies (industry 4.0) to help address urgent societal challenges. This work is carried out by integrating research to education and practical activities, in alignment with 3 profiling themes of the Faculty of Technology: Smart Industry, Circular Transition and Designing Future Cities.

3D Model

Three case studies

- Small item; personal
- Large item; building project scale
- Variable item

CW4N_Case Study_1_explorations

Prototype 1.0

Prototype 2.0

Prototype 3.0

'Once my door, now my coffee table'

CW4N_Case Study_2_explorations

*'Once their windows,
now our playground'*

CW4N_Case Study_3_explorations

'Once burned wood, now shared value'

Conclusions

1. Create awareness

Create awareness about the amount of circular wood coming from housing corporation assets: how much is available? and where does it end up now?

2. Build a database

Start by building a good database of materials that housing corporations have stored in their buildings. It is money for the future.

3. Survey your buildings

Explore advanced digital technologies for surveying buildings before renovation or demolition. This inspection will facilitate the implementation of more sustainable approaches (i.e. window frame repair), or else provide knowledge on the wood which can come available from a renovation or demolition.

4. Organize collaboration

Organize collaboration between corporations, their co-makers and other parties in the value chain , so that there is sufficient waste wood for applications, and the costs for processing it can be collectively supported.

5. Create pilot projects

Create pilot projects. Make them big: test a shared material bank and an application with sufficient scale for digital production to be a game changer.

6. Inform and engage citizens

Use pilots to step into the front-runner role of informing and engaging citizens about circularity and sustainability in their direct environment.

7. Explore alternative business models

Explore alternative business models, based on circular values and new financial opportunities coming from circular wood. A shift is necessary, from “paying for the wood to be removed” to “monetizing the wood that is available”.

8. Automate wood processing

Invest in automation for wood processing and explore circular applications in combination with advanced digital design and production processes, including robotics. It will pay out on the long term, given that virgin wood is rapidly increasing in costs and that there is an increasing shortage of skilled workers.

9. Use parametric design systems

Focus on parametric design systems that can be adjusted according to the available wood, and/or easily be adapted to a wide range of building and apartment typologies. While available wood may change -and the created product thus be slightly different- the costs of design and production can remain almost unaffected.

10. Certification schemes

Explore the gaps and limitations of current certification schemes for “new” building components vs. “circular” components. Which requirements -related to material quality, safety and durability- can be met by circular wood?
